

Business Requirements Document

HR Attrition Analytics Dashboard | Version 2.0

Field	Detail
Document owner	Seema Kumari, Data Analyst, Business Intelligence
Date	Aug 3, 2026
Platform	Microsoft Fabric (Lakehouse) + Power BI
Status	Dashboard built; BRD updated with findings and impact

1. Purpose

This BRD defines the business problem, approach, findings, recommendations and expected impact for the HR Attrition Analytics project. It aligns HR Leadership and the analytics team on what was solved, why it matters, and how success is measured.

2. Business Problem

Attrition stands at 16.1% (237 of 1,470 employees), above the 10–15% industry range. HR has no central, reliable view of where and why people leave. Attrition data sits in disconnected records, and analysis is manual, slow, and inconsistent between reporting cycles.

Unplanned attrition costs money: recruiting, onboarding, lost productivity during ramp-up, and lost knowledge. Without segment-level visibility, retention budget is spent reactively.

3. Business Objectives

- Measure overall attrition rate and track it on an ongoing basis.
- Find departments, job roles and employee segments losing people fastest.
- Show which factors (pay, tenure, overtime, travel, marital status, age) associate with attrition.
- Direct retention budget using evidence, not anecdote.
- Protect individual salary data while allowing broad exploration.

4. Scope

In scope

- Historical attrition analysis (current employees and leavers).
- Department, job role and demographic breakdowns.
- Pay, age, tenure, overtime, travel and marital-status drivers.
- Published two-page interactive dashboard for HR self-service.
- Column-level protection of MonthlyIncome.

Out of scope (future work)

- ML attrition risk scoring.
- Real-time alerting.
- Performance or disciplinary data.

- Payroll or finance system integration.

5. Approach

#	Step	What was done
1	Ingest	Dataflow Gen2 loaded raw HR CSV (1,470 employees, 37 columns).
2	Clean and enrich	Created Salary Band and Age Group columns for readable grouped analysis.
3	Store	Loaded to Fabric Lakehouse (Lh_HR) as flat table Hr_employees.
4	Model	Built Power BI semantic model with 5 core DAX measures.
5	Secure and publish	Column-level security on MonthlyIncome; published Overview + Deep Dive pages.

6. Key Business Questions

- What is overall attrition, and how does it compare to benchmark?
- Which departments and job roles lose the most people?
- How do pay and age relate to leaving?
- Which working conditions (overtime, travel, marital status) correlate most with leaving?

7. Key Findings

Segment	Attrition rate	Comparison
Sales Representatives	39.8%	33 of 83 left; company avg 16.1%
Age 18–25	35.8%	Age 36–45 is 9.2%
Overtime workers	30.5%	Non-overtime 10.4% (~3x gap)
Frequent travelers	24.9%	Non-travelers 8.0% (~3x gap)
Single employees	25.5%	Married 12.5%
Sales department	20.6%	HR 19.0%, R&D 13.8%

Findings show correlation, not causation. They guide HR judgment and do not replace it.

8. Recommendations

- Fix Sales Rep pay and career path; review quota load (highest-risk role).
- Review overtime policy and rebalance workload.
- Build structured onboarding and mentoring for employees aged 18–25.
- Cap travel or offer hybrid travel schedules for frequent travelers.

9. Expected Business Impact

Scenario: reduce attrition to 25% for Sales Representatives and for ages 18–25.

Measure	Result
Employees retained	~26 (about 12 Sales Reps + 13 aged 18–25)
Company attrition rate	16.1% → ~14.4% (inside industry range)
Replacement cost avoided	~1.0M (illustrative)

Cost assumption: replacement cost = 50% of annual pay; average monthly income $6,503 \times 12 \times 0.5 = 39,018$ per leaver. Current total exposure $\approx 9.2M$. Figures are illustrative and should be replaced with HR actual cost data.

10. Stakeholders

Stakeholder	Role / interest
HR Leadership	Sponsor and main user; retention decisions
Department Managers	Drill into own department attrition
Data Analyst (author)	Builds pipeline, model, dashboard
Workspace / IT Admin	Manages Fabric access and security roles

11. Success Metrics

Metric	Target
Time to answer a workforce question	Days (manual) → seconds (self-service)
Key question coverage	All Section 6 questions answerable without analyst
Data governance	Zero unauthorized exposure of individual salary
Attrition rate	Move toward 15% or below after actions
Adoption	HR uses dashboard in retention reviews

12. Assumptions and Constraints

- Data is a point-in-time snapshot; no exit dates, so no trend analysis yet.
- Under 2,000 records supports a flat-table model.
- Correlation, not causation.
- Stakeholders have or will be granted Fabric workspace access.

13. Deliverables

- Cleaned, modeled data in Fabric Lakehouse.
- Power BI semantic model with core DAX measures.
- Two-page interactive dashboard (Overview + Deep Dive).
- This BRD and a presentation deck.

14. Approval

Role	Name / signature / date
HR Leadership Sponsor	
Data Analyst (author)	Seema Kumari
